Background:

- DM Goal is to spend 3-4 days per week in field coaching their representatives
- Currently most managers allocate their field ride time somewhat equally among their team (not always prioritized) – shift from “equal to fair”
- Currently DM's skill at providing feedback service to their teams is widely variable
- Manager will meet the morning of their field ride to discuss territory performance, and the plan for the day together

1. **Business Objective:** Create an AI-powered agent for district managers that helps them determine:

1. Which reps to coach
2. What to coach them on
3. When to ride with or engage them
4. Which accounts or HCPs require attention
5. Which business opportunities or risks should shape coaching conversations
6. How to improve performance against business goals, including Summit ranking where relevant

2. **Business Problem:** District manager coaching is currently inconsistent. Some managers are highly skilled at combining data, field observations, coaching history, market performance, and business judgment. Others are less effective or less consistent.

Users:**Primary**

- District managers / frontline sales managers
- Regional business directors

Secondary

- Sales representatives
- Marketing/Sales leadership
- Training teams
- APEX team

Core Capabilities

MVP Capabilities: The first version should help district managers prepare for coaching and make

better business prioritization decisions.

The agent should be able to:

1. Prioritize reps for coaching

- Identify which reps need manager attention.
- Explain the reason for prioritization.
- Example: declining share, underinvestment in key accounts, gaps in call activity, missed coaching follow-up, payer disruption, or Summit opportunity.

2. Recommend coaching focus areas

- Suggest what the manager should coach each rep on. Example: Closing on new therapy starts , Using approved assets , Improving account prioritization, etc
- Feedback loop into the system; record thoughts verbally

3. Prepare manager for ride-along

- Surface prior coaching notes.
- Show prior agreed opportunities.
- Remind the manager what they said they would observe next time.
- Suggest how to open the pre-day business conversation.

4. Connect coaching to business outcomes

- Show market share, volume, account performance, investment, and activity trends.
- Highlight where rep behavior may not align with opportunity.
- Covariant analysis- what's the blend of variables and optimal variables that yield success?

5. Support Summit ranking optimization

- Use Summit calculation logic, where available, to show where the manager can get the greatest performance lift.
- Example: "Focus with this rep on these accounts because movement here could improve district ranking most."

6. Aggregate coaching themes

- Identify common coaching opportunities across reps, districts, regions, or nationally.
- Provide leadership with patterns rather than isolated coaching records.

5.Required Data Sources

Data Category	Example Source	Purpose	Notes for data access
Field coaching reports	Veeva coaching records, exported Excel reports	Prior coaching notes, observed strengths, areas for improvement, business reviews	
Rep call activity	Veeva / CRM	Understand where reps spend time	
HCP engagement history	Veeva / CRM	Determine whether priority customers are being reached	
Spend/investment data	AEBAT	Identify whether resources are aligned to opportunity	
Market size data	Internal analytics	Understand territory/account potential	
Share performance	Internal dashboards / prescription data	Identify growth, decline, or share defense needs	

Prescription/script data	IQVIA or internal reporting	Identify HCP behavior and performance trends	
Summit ranking logic	Incentive/Summit calculation files	Identify actions that could improve ranking	

6.AI and Analytics Approach

This use case should combine:

1. Business rules

- Territory alignment
- Role-based access
- Summit calculation logic
- Coaching cadence expectations
- Compliance constraints

2. Predictive analytics

- Identify reps or accounts with performance risk.
- Identify where manager time may have highest return.

1. Generative AI summarization

- Summarize coaching history.
- Generate pre-day coaching prompts.
- Generate post-day structured summaries from notes o
